# Fully Automated Human Pentesting
At a fraction of the cost to do it manually

KnowBe4 EZXploit™

Patent-pending functionality that allows you to do an internal, fully automated "human pentest" at a fraction of the cost to do this manually.

EZXploit takes your simulated phishing attacks to the next level. You can now find out which of your users can actually be exploited by hackers.

Using EZXploit, you can launch a simulated phishing attack on (groups of) users that contains a link to a web page – which if clicked on – is recorded as a 'failure' in your KnowBe4 admin console, but then takes an extra step and comes up with a secondary ruse like a Java popup that the user is social engineered to click on. If the user clicks on the secondary action, another 'failure' is recorded in your admin console. Their workstation can be scanned for several things like user name, IP address and other data related to that user's workstation and Active Directory information as specified by you in the admin console.
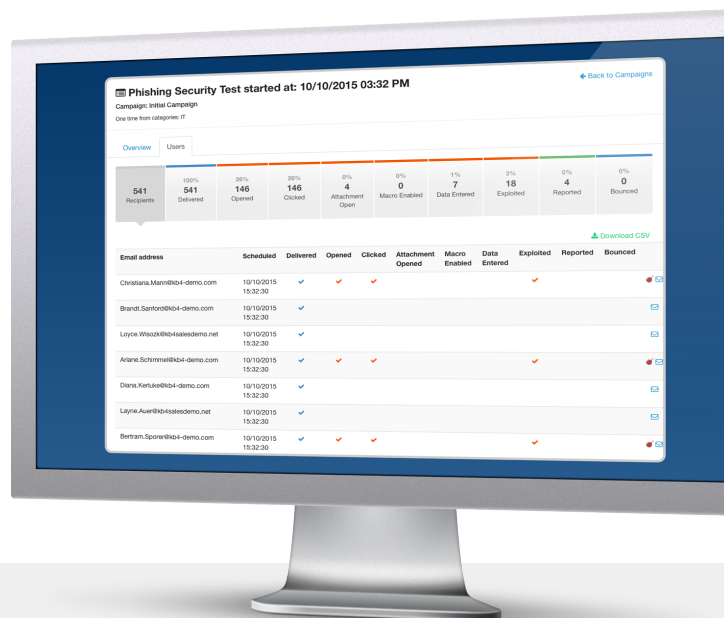

See the Results

Within your KnowBe4 admin console you can view the result data collected by EZXploit in a timeline preview as well as a full download of the data gathered. No malicious action is performed on the user's system and all private data is deleted upon campaign deletion.

EZXploit gives you a new, automated way to do human pentesting and prevent hackers from owning your network.

EZXploit is included in our Platinum Subscription
